Cortec® is benefiting from the purchase of RollAlign™, the latest in visual laser alignment systems. The laser unit will allow Cortec's Advanced Films and Coated Products to align machine rolls, reducing cost and waste.

With this investment, Cortec® will be able to do its own roll alignment with minimal down time. This new tool will allow the operator to view both the vertical angle and horizontal angle as the roll is adjusted into alignment. Without verification and control, several rolls can be out of alignment from 0.5" (1,27cm) to 1" (2,54cm) increasing waste caused by wrinkles and down time due to web breaks.

Always the primary concern, Cortec's customers will find the venture extremely beneficial. With decreased production time and a higher quality finished good, Cortec® is sure to satisfy.
